UNE GÉNÉRALISATION DU CRITÈRE DE D'ALEMBERT
POUR LES SÉRIES POSITIVES

Vasile BERINDE

Abstract. This paper give a generalization of the well-known ratio test (or D'Alembert's test), for series of positive terms, by introducing a "comparison series" with nonnegative terms. This result solves some undecidable cases in the use of the ratio test and furnishes a necessary and sufficient criterion for $\sum u_n$ to converge, when $u_n > 0$, $n \in \mathbb{N}$.
