

Dedicated to the 35th anniversary of the University of Baia Mare

On some operators of blending type

Dan BĂRBOSU

0. Beginning with the paper by Barnhill, Birkhoff and Gordon[1], the interpolation problem to boundary data on a triangle was largely studied. Important contributions to the development of this theory are due to Gh. Coman, I.Gânscoă and L.Țâmbulea [4], [5],[6]. So, in the paper [6] there are constructed some interpolants for a given function on the sides of a triangle T and on one of its median.
