Existence results for three-point boundary value problems for systems of linear functional differential equations

A. RONTÓ and M. RONTÓ

Abstract.

Conditions guaranteeing the solvability of certain three-point boundary value problems for a system of linear functional differential equations are obtained by using a special successive approximation scheme. We also establish some conditions necessary for a certain set belonging to the domain of the space variables to contain a point determining the initial value of the solution. An algorithm for selecting such points is also indicated.
